The Arts and Other Things

The Ritz's Air of Grandeur By Harold Hobson

That charming restaurant opposite the Madeleine where so gay a party was held last night, the Ritz's "Petit Perdu" is not only a cafe, a cafe for quick eating, but that other noble place where Frost entertained his friends, the Ritz's, the Place Vendôme, is still there, as majestic, as calm, as smooth, as established, as ever.

Stephen Watts, in his just-published "The Ritz: a history of life in the world, and I shall certainly not contradict him. Mr. Watts has written the most satisfying account of a great hotel I have ever read.

It is not, as it is so easily might have been, a run-down of the illustrious names that have stayed at the Ritz. That would have been a noble roll call, for the eminent in almost every walk of life come to the great Parisian hotel. Everyone has heard about the princes and the maharajahs and the grand dukes, but this summer I saw Samson Becken, the himself lunching there, though I must admit only as a guest of one of the residents.

Mr. Watts notes that film stars are not in general welcome at the Ritz, with such exceptions as Charlie Chaplin and Audrey Hepburn. But Mr. Watts does not rely on this. He writes a remarkable study of Claude Auzuel, who has run the Ritz for the past 12 years. He has as acquainted with Arnold Bennett tried to do in "Imperial Palace" to show how a great hotel works.

It would be absurd to pretend that the Ritz is within the reach of every pocket, but it is far less expensive than many hotels much less good. Eight of its 210 rooms are only about \$2 a day. Double rooms are \$2.10 a day, and an ordinary suite costs from \$11 to \$24 a day. The suite which I stayed in the Duke and Duchess of Windsor

is \$270 a week, and that which Barbara Hutton retained for years whether she was in Paris or not is simply dearer. But though there is an undeniable air of grandeur about the Ritz, it is anything but flamboyant. Its spaciously, its quiet, restful assurance, its exquisite painted ceiling, and its grace are not more memorable than the humanity, the excellence, and the courtesy of its service. It is pleasant to a hotel where your name will be remembered not only by the manager, but by the concierge, the telephone operator, the maître d'hôtel of the restaurant, and the manager of the three hotel bars which is situated just in the entrance to the salon de la

Henri Galpin is in fact a remarkable man. He was born in Vermont of French parentage and brought up in Washington, D.C. It is not surprising therefore that he has an extraordinary fluency in English with an American accent. He came to France when his father was called up in 1914. He has been at the Ritz since 1916, and he is a man of universal information.

I now am reading a life of Tallulah Bankhead which he lent me during the summer; last winter he educated me, through the medium of a book by Peter Fleming, in the Boxer rebellion. He knows everything about the Paris theatre, I have known him for months whenever I am in Paris.

He seems always to get seats; the very seats that one asks for. I have never known anyone else so skillful at doing this as Monsieur Galpin. Within half an hour of my arrival in Paris I have those little green slips in my pocket which assure me of seats at all the plays I want to see while I am out of town.

Calm and restful as it seems—and is—the Ritz is also the most efficient hotel I know. In the time I was there I never saw a man work in an atmosphere of civilization.

Island Mystery

About Kind Mrs. Robinson Crusoe By Harlan Trott

The strange story of a Mrs. Robinson Crusoe who lived alone for 18 years on California's deserted San Nicolas Island is being told again by a group of college professors who have been exploring this outermost island in the Pacific.

The professors think San Nicolas very probably was seen by Bartolomeo Ferriero when he left Santa Cruz Island on Feb. 18, 1543, to search for other islands reported by the inner islands. But Juan Rodriguez Cabrillo's chief pilot must have thought this 32-square-mile rock wasn't worth naming. Capt. Sebastian Vizcaino named it in 1602; but he was way out of his reckoning when he named it this name.

In 1780, Capt. George Vancouver discovered that San Nicolas was not near Vancouver's coast. He showed it later on, and the breakers, they named it Sea Otter Island. Here is the way Mrs. Crusoe's lonely abode

One woman for some reason was left behind. From time to time people on the mainland thought about the poor old Nicoleno, but no action ever was taken to look for her. Many doubted that she still was living. In the time of the late Capt. W. E. Bullard, the island was the last of the legendary limbo of the 15th.

Recently account shows no search was made for 18 years. Then the mission fathers offered a \$200 reward to find her. An other hunter found an empty hut made of whale-bones. In 1853, George Nidever, a Santa Barbara resident, found another search party. Nidever found a footprint, the first day after, and then a basket of feathers.

The next day, a distant figure was seen gliding up the hill to the whalebone hut. Nidever's party followed her. She was a woman about 50 years old, thin and dark. She showed no fear. The Indians in the search party fell on their knees. The woman offered them food—roots that had been rooted in an open fire.

Her diet consisted of seal meat, fish, abalone, and sea urchins. Sewing was done with bone needles. She had a knife made out of a piece of iron hoop stuck into a rough driftwood handle. She wore grass into water-lily baskets coated inside with asphalt. San Nicolas isn't very far from Coal Oil Point, where most of Santa Barbara's oil is produced. The island is a small, flat, and almost overgrown. The eastward dress was a single garment made from the skins of a seabird called the "saga" or "saga."

She left willingly with Captain Nidever who took her to his home in Santa Barbara. The Indians in the search party followed her. She was a woman about 50 years old, thin and dark. She showed no fear. The Indians in the search party fell on their knees. The woman offered them food—roots that had been rooted in an open fire.

Her husband's name is said to have been sent to the Vatican. A few other primitive possessions were found. San Francisco was destroyed in the 1906 earthquake and fire. The eastward dress was a single garment made from the skins of a seabird called the "saga" or "saga."

From the Bookshelf

Sport Through the Ages By Ed Rumill

Superman, Hercules and Gods, by Walter Unger. Illustrated. New York: The Grosset-Hill Book Company. 342 pp. \$7.95.

This book is, as the subtitle says, the story of sports. It is a book of facts, and you might wonder whether or not a few of the subjects deserve to be called sporting events, the list is long and all-inclusive.

Going right back to the beginning, Mr. Unger starts with the ancient Greeks and finishes with Yuri Gagarin, the Soviet who was the first man in space.

Along the way the author gives the highlights of cycling, mountain climbing, boxing, wrestling, tennis, basketball, baseball, back riding, tennis, baseball, swimming, and all sorts of speed—the athletic, the constant struggle against the forces of gravity and time.

"Superman, Hercules and Gods" is divided into four parts, which are titled as follows: The Book of Believers and Fanatics, a disbeliever's study of the gods and legends and imitate them through sports; The Book of Humankind and Warriors, dealing with the legends of war and sports; The Book of

Gladstones, which describes the arena through the ages; and The Book of the Driven, in which the author analyzes the excesses and compulsions that have inspired achievement.

The author traces the Olympic games back to its origin, a timely subject in the weeks ahead when the games will be held in Athens. But perhaps most noteworthy in Mr. Unger's literary effort is the significance of athletics in the development of civilization—how human beings learned to excel to the present day—a rather complex, but authentic picture of the playing of all of the world's most popular games.

Without mankind's eagerness for athletic engagements, there might have been little progress in the world. The author improves themselves and their families, less exploration, perhaps less progress.

The author has woven a beautiful selection of anecdotes into the unfolding of the story. It is a book of facts, and you might wonder whether or not a few of the subjects deserve to be called sporting events, the list is long and all-inclusive.

Age of Nonwhite Reassertion: Ghanaians Seek Voice in World Affairs

Race: 20th-Century Issue

The great confrontation of our times is between white and non-white. The nonwhites are in revolt against four or five centuries of white hegemony around the globe. Until World War II, it is generally agreed, whites were the arbiters of world affairs. Now nonwhites are determined to play a part in world history commensurate with their numbers.

By Geoffrey Gossell
Star Writer of The Christian Science Monitor

THE PROBLEM of the 20th century is the problem of the color line—the relation of the darker to the lighter races of men in Asia and Africa, in America and the islands of the sea. So wrote the American Negro writer and scholar, the late W. E. B. DuBois, in 1903, long before he joined the Communist Party of the United States, bitter and disenchanted.

The subsequent course of Dr. DuBois's life has in no way robbed this perceptive observation which he made more than half a century ago of its validity. The white and nonwhite around the globe has been one of the great dynamics in the past two decades that have changed the world from what it was at the outbreak of World War I.

Mankind, in fact, constitutes only one race: the human race. But nature has divided mankind into many races, which are more accurately described as subspecies. But acceptance of a "humanity" concept is not new. Respective of color—throughout history has been a struggle of conflict between people.

One ethnic group too easily assumes that it is superior to another, or even to all the rest, and seeks to assert its superiority in action; in days, the victors in war carried off the vanquished into slavery—a practice which was repeated as recently as in World War II by the Nazis.

Even today, minority racial groups within states resort to violence against what they believe are oppressive majority groups of the same color: Kurds against Arabs in Iraq, Turks against Greeks in Cyprus, and so on.

But perhaps most noteworthy in Mr. Unger's literary effort is the significance of athletics in the development of civilization—how human beings learned to excel to the present day—a rather complex, but authentic picture of the playing of all of the world's most popular games.

Without mankind's eagerness for athletic engagements, there might have been little progress in the world. The author improves themselves and their families, less exploration, perhaps less progress.

Island Mystery

About Kind Mrs. Robinson Crusoe By Harlan Trott

The strange story of a Mrs. Robinson Crusoe who lived alone for 18 years on California's deserted San Nicolas Island is being pieced together by a couple of college professors who have been exploring this outermost rock in the windswept Channel Islands.

The professors think San Nicolas very probably was seen by Bartolomé Ferrello when he left Santa Cruz Island on Feb. 18, 1543, to search for other islands reported lying off the inner group. But Juan Rodriguez Cabrillo's chief pilot must have thought this 32-square-mile rock wasn't worth naming. Capt. Sebastian Vizcaino named it in 1602; but he was way out of his reckoning when he plotted it into his chart.

In 1793, Capt. George Vancouver discovered there was no San Nicolas where Vizcaino's chart showed.

Early fur traders found it later on; and because of all the sea otters playing in the breakers, they named it Sea Otter Island.

Here is the way Mrs. Crusoe's lonely abode

To Change the Subject

looked to George Davidson when he was charting and sounding for the United States Coast and Geodetic Survey in 1854:

"Of the Channel Islands this . . . is the driest and most sterile. Two-thirds of the surface of the island is covered with sand, and the remainder with coarse grass. Small patches of scrub oak are found in a few places, but no trees show on the island as made from seaward. It can be seen from the deck of a vessel at a distance of 38 miles. . ."

Nothing is known about how men first came to San Nicolas, but the earliest settlers—Indians—found it much more hospitable than it is today. The Indian name for the place was Ghalashat.

The combined researches of Prof. Clement W. Meighan, University of California at Los Angeles anthropologist, and Santa Barbara geologist Prof. Robert M. Morris lead to these conclusions. The shells of land snails indicate a fairly heavy vegetation at one time and also abundant water. Today there are only a few springs at the northwest end. From all the archaeological remains, San Nicolas was a bustling primitive community.

Dr. Meighan speculates some of the Indian population of Ghalashat may have been recruited for mainland missions by the early Spaniards. In 1835 there were only 20 inhabitants left. That year church authorities at Santa Barbara decided to transfer this small population to the mainland.

One woman for some reason was left behind. From time to time people on the mainland—thought about the poor lost Nicoleno, but no action ever was taken to look for her. Many doubted that she still was living. In time she drifted into the legendary limbo of the lost.

One early account shows no search was made for 15 years. Then the mission fathers offered a \$200 reward to find her. An otter hunter found an empty hut made of whalebones. In 1853, George Nidever, a Santa Barbara otterman, headed another search party. Nidever found a footprint, the first day ashore, and then a basket of feathers.

The next day, a distant figure was seen plodding up the hill to the whalebone hut. Nidever's search party followed. Inside the hut they found a woman about 50 years old skinning a sea lion. She showed no fear. The Indians in the search party fell on their knees. The woman offered them food—roots that had been roasted on an open fire.

Her diet consisted of dried seal meat, fish, abalone, and sea urchins. Sewing was done with bone needles. She had a knife made out of a piece of iron hoop stuck into a rough driftwood handle. She wove grass into watertight baskets coated inside with asphalt. San Nicolas isn't very far from Coal Oil Point, where coast surveyor Davidson a hundred years ago found "the smell of petroleum . . . almost overpowering." The castaway's dress was a single garment made from the skins of a seabird called the "shag" or green cormorant.

She left willingly with Captain Nidever who took her to his home in Santa Barbara and placed her in the care of his Spanish wife. None of the Indians understood the lost woman's language. She seemed to enjoy the community's attentions, visiting various families and dancing for their entertainment.

But she languished in her new environment. In six weeks after she was "rescued" from San Nicolas, the "lost" woman had passed on. Dr. Meighan says this is not unusual in cases where North American Indians were carried to England or Eskimos have been brought to the United States.

Her birdskin dress is said to have been sent to the Vatican. A few other primitive possessions forwarded to San Francisco were destroyed in the 1906 earthquake and fire. The untold part of her story is wrapped in winter fogs or muted in the timeless surge of maelstrom breakers beating against the 800-foot cliffs below the site of that whalebone hut and the winking 12-mile lighthouse of San Nicolas Island's untended lighthouse.
