

MESSAGE OF GOOD WILL FROM UNITED STATES

The Great Republic Will Assure the Lesser Ones in South America That No Policy of Conquest Is Entertained Here.

DISTRUST TO BE REMOVED

Unceasiness. Washington, October 12.—To thoroughly impress the fact upon the representatives of the United States that the United States is not languid and unenterprising, and that it is hungry and enterprising no dream of comfort and ease is indulged in, and that the most important duty imposed upon the United States delegates who start today for the Pan-American conference to be held in the City of Mexico.

It is the feeling of the state department to these gentlemen have been full and explicit upon this subject. Ever since the war with Mexico, there has been a growing feeling of distrust among the people of the United States toward the great and powerful northern neighbor. This feeling, partly due to the knowledge that the United States had been so sympathetic with Spain because of old traditions, and partly due to the fact that the United States was expanding beyond the limits of the North American continent, had been a source of great concern to the people of the United States.

**FATAL FALL OF
SLATE IN MINE**

One Miner Killed and Two Hurt Near Pitcairn Yesterday.

The accident at the mines of the Boyd & Dempster Co., on the Pennsylvania Railroad, between Wilmerding and Pitcairn, yesterday, resulted in the death of one workman and the injury of two more,

JURIED DEAD.
THOMAS PROBERT, 36 years old, of 1001 E. 12th St., was killed by a logging truck when he was struck while working on the logging camp. He was taken out by rescuers and died.

INJURED
JOHN WILHELM, aged 31, lived at Pictorial, sustained numerous cuts upon his body by working in the logging camp. His right arm fractured, and cut and bruised.

DEAD
MICHAEL PISTALO, an Italian, also lived at Pictorial, was killed by a logging truck when he was struck on the top of head four inches long and three inches wide. He died.

DEAD
A local car which tore loose one of the engine supports, caused the accident. Pictorial was caught under the timber in the logging camp. He was killed until they were rescued an hour later. He was taken out by rescuers and died when they received surgical attention.

DEAD
The logging camp is known as the Spring Hill mine. It is located on the railroad cut off.

ENGLAND LOOKS FOR TROUBLE

Two Field Hospitals Are Mobilized on the Afghan

Bombay, October 12.—Two field hospitals have been mobilized at Peshawar, a strategic point on the Afghan frontier of Punjab, in case a precautionary measure in case a force should be assembled for Afghanistan.

The dispatch indicates that England fears trouble in Afghan and is getting ready to mobilize a force and the Indian orders to protect her interests.

An internal strife regarding the succession to the late amir is feared.

CAT BIRD.

There is a commotion in the clouds. The upper air is agitated by the fluttering of countless multitudes of wings, and a distant, indistinct chirping signifies that the birds are bidding us farewell for a season. The annual migration from north to south has begun. The feathered and myriad-hued denizens of the air are hurrying away from the chill breath of autumn, winter's forerunner, to seek refuge in climates where summer sits unchallenged on her throne of roses.

The migration of the birds began during the middle of September, but the general departure is not usually on in full swing until the first of October. Now the merry little fellows, who have sang and whistled about the fields and the forests during the golden days when the sun shone and nature smiled, are scurrying away in flocks averaging anywhere from 100 to 1,000, and soon only the ever-present English sparrow, with a few other hardy species, will be left to remind us that summer did exist, and that it will come again.

Pennsylvania is a notable bird state. Several hundred species find homes and happiness within the borders of the old Commonwealth. The robin, of course, leads in numbers as well as in popularity. This is a hardy bird and during the migratory period does not go as far south as its more delicate comrades; thus it is custom-

ary for the bird to return in the spring, and its appearance is widely accepted as an indication that winter's reign is ended. In the winter months it is not uncommon to find small flocks of robins about cedar thickets, swamps and other well-sheltered localities, especially in the southern parts of the state. Scientists say that the robin is of great value to the husbandman, in that he devours the worms and grubs which, if allowed to live, would ravage and destroy the crops.

The bluebird is another bird found everywhere in this state, and, like the robin, he does not migrate far nor early. The southern counties of the state seem to be sufficiently distant for them to travel, and they are abundant there during the winter. The bluebird is also an early returner, and is usually seen in his old haunts about the same time as the robin. Since the English sparrows have become so numerous, blackbirds, in common with other species of birds which formerly were regular summer residents about yards, gardens and parks, have been driven away.

The family Icteridae includes blackbirds, orioles, bobolinks, meadow larks, etc., comprising in all nine species. There are several varieties of blackbirds, but the country boy, as a rule, makes no distinction, and tries to kill them on sight because of their fondness for grain.

The bobolink is a melancholy example of degeneracy produced by gluttony. He makes his home in Pennsylvania during the summer, feeding daintily and singing merrily. Then he goes south to fall from his high estate. When he sheds his showy dress of black, white and yellow, he frequents chiefly the reedy marshes of tide-rivers, and is known as the "reedbird"; in the Carolinas, Georgia and elsewhere in the south they congregate in great numbers on the rice fields and are known as the "ricebird." The birds feed so well there that they become plump and are slaughtered in great numbers for the table.

The general run of Pennsylvania birds are so familiar to the average person, that no extended description of their character is required. Just now they can be seen flocking through the air, on their winter tour, but most of them will return, many with mates and some with large families.

An Expedition from the University of California Will Visit the Ghoulish Land that is Spread Over with Skulls and Thorntrees of a Lost Race

...speaking of that death at a meeting of the Southern California Medical Society the other day, Dr. Walter Lindsey said that if the woman could have been spared a few years of life a story of one of the strangest races that ever lived

Three years later this terrible woman and Malatesta instigated the peasantry of Northern Italy and Spain to commit crimes as a protest against the bread

try that the Knows How to Get out of Financial Trouble.

A strong nation, with the economic structure which makes progress and growth possible, is one that has been rich and expanded so fast in business and investments and improvements in living standards that it has become a world power.

One people and must retrench, it is found that they cut down their expenditures, their savings, and their investments in other countries and sell their property and their investments in other countries.

In the Southwest and that had no contamination with the whites might have been learned. The woman, however, was a native of the Southwest and has been the subject of a score of romances and has been married a number of times in the Pacific coast for years.

San Nicolas is about 100 miles long and 40 miles wide. At the widest point, its topography shows a nearly level surface. The average height of the island, 1,000 feet, 72 inches of the surface is covered with thickets of nutritious grass and moss on which live a number of birds. The water in their water is slightly brackish. Of late years the island has been rarely visited except by shepherders and dairy-gatherers, who make a winter trip to the archipelago, running smacks and Chinese junk.

San Nicolas is the only island around San Carlos formed from the main barrier of the shore. The entrance is but six or seven miles wide. The island is a high, steeply sloped as a lake and sufficiently deep to admit a vessel of 20 tons weight at low tide. A break, silver strip of beach immense

Roosevelt had been by President Harry Truman to the Civil Service Commission with friends, and with Harry C. Crisp, a Democrat (D) who evidently sided to the South and contemptuously called as traitors the demonstrators and strikers. Roosevelt said that Crisp could not be trusted. Crisp was not satisfied with the demonstration and the Southern people were not. Roosevelt repeated the thing that many of his friends said at that war, and that was offensive to the Negroes. He repeated the thing that many of his friends said at that war, and that was offensive to the Negroes. He repeated the thing that many of his friends said at that war, and that was offensive to the Negroes.

LOS ANGELES, Cal., October 9.—An air of mystery pervades each of the little islands in the scant archipelago off the coast of California. San Clemente Island is strewn with enormous prehistoric mortars and pestles, and here and there are numerous evidences that a giant race lived there before the Portuguese navigator, Cabrillo, sailed for conquest up the coast of Alta California, in 1542. Santa Catalina is indented by many strange caves, weird grottoes, where one may see remains of a race of fishers and artisans with shells. San Miguel Island has been the scene of titanic erosions by ice, water and sand. The grotesque pillars that lift themselves above the island level, the winding caves that twist from the shores to the heart of the island and the roaring gulches and canyons all comprise a spot rich in possibilities for both scientist and dreamer. Santa Cruz Island is used as a pasturage for thousands of sheep, and it, too, is full of absorbing interest regarding extinct races of aborigines. The Smithsonian Institution scientists have gathered tons of stone, shell and bone utensils and personal ornaments from Santa Cruz. But San Nicolas Island has by far the most abundant evidences of a tribe of unusually tall and strong people who must have vanished almost in a night. Of all the California archipelago this is the most mysterious.

Notwithstanding the islands—known on the Pacific coast as the Channel Islands—are but from thirty to fifty miles out in the blues of the ocean, they seldom are visited. Every few years an exploring expedition goes to them for a season of scientific study, but, with the exception of Santa Catalina—a famous summer resort for California pleasure-seekers and anglers—a half-dozen visitors do not land at any of the islands once a year. Today the islands remain as lonely and desolate as they did long before the first white face sailed to the coast—300 years ago. The races which occupied these islands are as much of a mystery as ever, and so far science is baffled in inquiring what sort of folks these aboriginal settlers were, how they lived, what they believed, and especially how they so suddenly and completely disappeared from the face of the earth.

The University of California, at Berkeley, is about to begin the most thorough exploration ever made of San Nicolas Island, which lies sixty miles off the coast of Ventura and Santa Barbara counties.

As far back as the memory of any person in southern California runs hundreds of white skeletons have dotted the valleys

and hillside of San Nicolas. Strange utensils of serpentine, sandstone and steatite are found there among the human bones, and the island and its inhabitants have a history so curious that it is difficult of comprehension.

In 1835 Franciscan padres in the Santa Barbara mission, learning that there were but 18 of the strange and almost extinct Indian race then living there, determined to rescue them from the island. They went over in a sloop and succeeded, as they thought, in getting all on board. At the last moment an Indian woman returned for her child, and one of the frequent storms of the Channel Islands springing up, the sloop was driven away without her. The sloop went on the rocks of Point of Conception and all on board were lost.

Sixteen years later Capt. George Nidever and two men went from the coast on a sloop to hunt seal otter off San Nicolas. On landing they were, like Crusoe, astonished to find human footprints in the sand. They saw no one, however, and a storm compelled them to put to sea.

It was two years thereafter that the adventurous captain, revolving in his mind the sight of the footprints in the uncanny island, determined to go and discover and bring over the lonely woman of whom he had vaguely heard. Men accompanied him, and at length they saw on the surf-beaten shore a woman with long, tawny hair, dressed in a queer garb of colored bird skins, and scraping with a bone knife the blubber from a seal.

They surrounded and approached her stealthily, and although suddenly confronted, she did not appear in the least afraid, but smiled, and then, falling on her knees, prayed to the sun. The wild woman offered no objection when by signs she was made to understand that she was to go with them in the boat.

They reached Santa Barbara across the rough sea, and the first thing the Indian woman saw was Dr. S. L. Shaw, now 80 years old, and yet living there, riding a horse. She had never seen or heard of any object like it, and thought the man and horse were one, and she knelt on the shore and offered her devotions to it. Two weeks afterward the last inhabitant of rockribbed, tempest-tossed San Nicolas died from eating food to which she was unaccustomed, furnished by her rescuers, and the curtain fell on her race forever.

In speaking of that death at a meeting of the Southern California Medical Society the other day Dr. Walter Lindley said that if the woman could have been spared a few years of life a story of one of the strangest races that every lived

In the Southwest and that had no contamination with the whites might have been learned. The woman, known as the "Lone Woman of San Nicolas," has been the subject of a score of romances and poems and food for a lot of philosophy on the Pacific coast for years.

San Nicholas is ten miles long and four miles wide at the widest point. Its topography shows a nearly level plateau, with an elevation of 500 to 1,000 feet. Two-thirds of the surface is covered with drifting sand, and the remainder grows a species of nutritious grass and moss on which a thousand sheep find pasture. Seawater is slightly brackish. Of late several springs have been discovered, but years the island is rarely visited except by sheepshearers and shell gatherers, who make annual trips in schooners, fishing smacks and Chinese junks.

The only safe landing ground at San Nicholas is at Coral Harbor, a pretty cove formed by two sandstone arms thrust out from the main barrier of the shore. The entrance is but six or seven yards across, and the water within is placid as a lake and sufficiently deep to float a vessel of 20 tons burden. On the bleak, silvery strip of beach immense white pelicans are to be seen at almost any season of the year promenading with a stately dignity. On the approach of the dingy they spread their heavily pointed wings and vanish over the rocks. Further up the shore of the beach there is a dilapidated shearing shed and a weather-worn shanty belonging to Chinese shell

gatherers, who haunt these lonely cliffs during late summer and fall.

Nothing more desolate than the general appearance of the island can be imagined. As far as the eye can trace there are innumerable circular depressions, showing where primitive dwellings once stood. Not a vestige remains of the materials used in the construction of these rancherias. Hundreds of shell mounds are scattered about and are found to consist of astonishing numbers of mollusks, the bones of every species of fish found in the channel, skeletons of seals, sea elephants, whales, sea otter, the island fox and various aquatic birds. Without question these animals were used for food by the tribes that once thronged these boundaries. There are also numerous canine skeletons, several of which indicate a species of bull terrier.

~~~~~

Judging from the immense quantities of dead land mollusks everywhere, there must have been a time when the island supported luxuriant vegetation. Of all this verdure nothing is seen today but a few stunted thorn bushes and now and then a cactus forlornly reaching its grotesque arms out of interminable sweeps of sand.

An examination of some of the mounds discloses all sorts of curious utensils, stone cooking pots, water ollas, mortars, pestles, drills, bone needles and fishhooks, shell beads, charm stones, pipes, cups and a few arrow heads, spear points and swords made of bone. The absence of many weapons proves the peaceful attributes of the islanders. Small imitations of boats and fish carved from crystallized talc and serpentine also show a rudimentary knowl-

---

edge of the art of sculpture. In many places conical piles of small black pebbles contrast oddly with the white land. In some instances these shells were closely packed in abalone shells. No trace is seen of the "brush pen," in which the lone woman of San Nicolas for years found her only shelter from the cutting wind and sand. Nature, ever unmindful of the individual, long since merged the super-human efforts of this courageous life into the universal fate of an entire race. Indeed, every foot of this strange island is eloquent of the extinction of an almost unheard-of people.

A trip along the west coast of San Nicolas Island over a vast extent of shell mounds sets one to wondering how it was possible for a limited population to consume such prodigious numbers of mol-

---

laska. In fact the infinite variety of mollusca on San Nicholas is said by biologists not to be exceeded by any other known region of equal area. The shore line is of coarse sandstone burrowed by the pounding surf into fantastic alcoves, bridges, columns and caves. Sometimes these savage cuts form rude effigies bearing a surprising likeness to living creatures. One of the most conspicuous is the exact counterpart of the neck, breast and body of a bird with an alert, hooded head. This piece of nature's sculpturing must be 40 feet long, and beheld from a distance looks quite as perfect as if fashioned by man. There are hundreds of photographs of this freak of nature sold all over California.

Going westward from this gnawed, surf-lashed wall, the ground makes a gentle descent to a wide mesa, terminating in a steep escarpment. The atmosphere from this elevation is so deliciously clear that the eye can readily distinguish the peak tops of all the Channel Islands, several of them being 40 miles away. Immediately at one's feet there stretches away a dreary desert of stupendous barrenness. A singular characteristic of the place were heaps of the bones of whales, their arrangement and packing so systematically correct as to have withstood a century's sweep of winds over this exposed point. But one human skeleton has ever been found there, its bleached, dismembered aspect in keeping with the driven desolateness of the spot. The merciless blast had piled the sand dunes all about, but spread no kindly drift over this "rough sketch of man." All around are the casts of roots of trees in the shifting sand, ranging all the way from

coarse fibre to several inches in diameter. These semi-petrifications are all intact, the wind having swept them clean of the loose earth. They yield a metallic ring when tapped with a rock or shell. A still more remarkable feature of this desert is a sparse stone forest, the broken columns or trunks of trees composed of indurated sand.

At the extreme west end of the island there is a colossal precipice 1,000 feet in height, its channeled and pitted face softened by a luxuriant growth of emerald moss and lichens. The most gruesome of all the sights on this strange island is to be seen on the broad plateau on the south side of the Chinese camp, at Coral Harbor. Here acres of the naked sand are littered with hundreds of disjointed skeletons and present the most reckless illustration of the "ground plan" of humanity that imagination can picture. Measurements have been taken by several scientists of the thigh, leg and arm bones, and literally bushels of skulls and other parts of the human frame have been brought to Los Angeles from San Nicholas for investigation. The general opinion is that the physiques of the Indian race that swarmed over the island then were much larger than those of any civilized race of today, and that some of them must have been 7 feet 2 inches tall. The skulls of this extinct tribe often measure several inches more than some of the large skulls of today. Many skulls found lying about on the island show that their possessors must have suffered death from a club or blunt battle ax. No one has ever yet found a skull on San Nicholas that shows marks of a bullet. There are many collar, bone and shoulder blades broken and crushed, so that it is evident their owners were slain with some such instrument as a war club or boulder. Scientists say that the favorite weapon in warfare of the Aleutian savage tribes a century or more ago was a club or bludgeon, and this fact fits with the stray tradition that the Aleutians came down and completely destroyed the people on the Channel Islands about the year 1570.
